Java Prep Test

Using Java 11, write code (with tests that correctly validate it) to complete the following two problems:

1. Given a list of integers, find the two largest integers and return them.
2. Given a HashMap<String, Integer> of student full names and their test scores (1 - 100), find the following answers:
   a. The average test score
   b. The highest test score
   c. The lowest test score

You may not use complex in-built methods, such as .sort()!

Best of luck!
